Oops!

Let me clarify something

To understand what `querySelector` **does, you need to understand CSS** selectors. And when I was talking in the previous lecture, I mentioned this as an example:
`#test .demo`
I was wrong when I said that this CSS selector will select an element with ID of test and class of demo.

Let me make a correction.

`#test .demo` **will select an element with a class of** "demo" that is **a descendant** of a parent element with an ID of "test".
`#test.demo`, however, will select an element with an ID of "test" **and** a class of "demo".
Hope this clears things up.

Sorry for the confusion.

KEEP GOING AND SEE YOU IN THE NEXT LECTURE
