Section 6 - Quiz: Creating, Removing and Cloning DOM Elements

Question 1:
What method do we use to create a new element to the DOM?

- **We use the `createAnElement()` method. The way we access it is directly on the window object.**

- **We use the `createElement()` method. The way we access it is via our document object and pass in the HTML tag name of the element we wish to create.**

- **We use the `insertElement()` method. The way we access it is via our document object and pass in the HTML tag name of the element we wish to create.**

Answer: B

Question 2:
What is the correct way to create a `<div>` element?

- `document.createElement(div);`

- `document.insertElement("div");`

- `document.createElement("div");`

Answer: C

Question 3:
What statement below is true about this line of code:

```
1. document.createElement("p");
```

-

  This code will create a paragraph element, and pretty much stop there.

-

  This code will create a paragraph element and add it to the DOM dynamically.

-

  This code will throw an error, as we have not placed our paragraph element anywhere.

Answer: A

Question 4:

What does the `parentElement.appendChild(newElement)` method do?

-

  It adds the `newElement` as the first child of the parent element.

-

  It adds the `newElement` as the last child of the parent element.

-

  It adds the `newElement` immediately before the parent element.

Answer: B
